

## ABSTRACT OF THE DISCLOSURE

5           A cargo container having a floor, a front wall, and spaced side walls. The floor, front wall, and spaced side walls cooperatively bound a cargo storage space. The front and spaced side walls each have an exposed inside surface bounding the cargo storage space and an exposed outside surface. The front and spaced side walls cooperatively define a peripheral wall structure having a top and bottom.

10          At least part of the peripheral wall structural has at least one corrugated sheet having alternating ridges and grooves. The ridges and grooves have lengths extending in a direction between the top and bottom of the peripheral wall structure. At least part of the peripheral wall structure has at least one external panel that is connected to the at least one corrugated sheet so as to define a

15          substantial area of the exposed outside surface.
